Name

B SHRINIVAS

Roll Number

KUB23CSE018

## EXPERIMENT

Title

ENCODE THE NUMBER

Description

You work in the message encoding department of a national security agency. Every message that is sent from or received in your office is encoded. You have an integer N, and each digit of N is squared and the squares are concatenated together to encode the original number. Your task is to find and return an integer value representing the encoded value of the number.

**input1:** An integer value N representing the number to be encoded.

**Output :**

Return an integer value representing the encoded value of the number.

Sample Input:

167

Sample Output:

13649

Source Code:

```
def encode_number(N):
    # Convert the number to string to access each digit
    digits = str(N)

    # Square each digit and concatenate the results
    encoded_str = ''.join(str(int(digit) ** 2) for digit in digits)

    # Convert the concatenated string back to an integer
    encoded_value = int(encoded_str)

    return encoded_value

# Example usage
N = int(input().strip())
result = encode_number(N)
print(result)
```
