Title

SUM OF NUMBERS AT PRIME FACTORS

Description

Prime factors of a positive integer are the prime numbers that divide that integer exactly.

Given an array arr of n integers and a positive integer num.

Let's suppose prime factorization of num is: $p^a \times q^b \times r^c \times \times z^f$, where p,q,r...z are prime numbers.

Sum of numbers in array arr at indices of prime factors of number num is: a x arr[p] + b x arr[q] + c x arr[r] +..... + f x arr[z].

You are given an array arr of size n and a positive integer num. You are required to calculate the sum of numbers in arr as mentioned above, and print the same.

Note:

- If arr is empty, print -1.
- If prime factor of num not found as indices, print 0.

Input Format:

The input consists of three lines:

- The first line contains an integer, i.e. n.
- The second line contains an array arr of length of n.
- The third line contains an integer num

The input will be read from the STDIN by the candidates.

Output Format:

Print the sum that was mentioned in the problem statement.

Example:

Input:

6

11 21 32 45 1 23

6

Output:

77

Explanation:

1/2

The State of the S

```
6=2<sup>1</sup> x 3<sup>1</sup>
sum=1*arr[2]+1*arr[3]=1*32+1*45=77
```

3673

Source Code:

```
def prime_factors(n):
   factors = []
   # Check for number of 2s that divide n
   while n % 2 == 0:
        factors.append(2)
        n //= 2
   # n must be odd at this point, check odd factors from 3 to sqrt(n)
   for i in range(3, int(n**0.5) + 1, 2):
        while n % i == 0:
            factors.append(i)
            n //= i
   # This condition is to check if n is a prime number greater than 2
    if n > 2:
        factors.append(n)
    return factors
def sum_of_prime_indices(arr, num):
    if len(arr) == 0:
        return -1 # Handle empty array case
   factors = prime_factors(num)
    unique_indices = set() # Use a set to avoid duplicates
    for factor in factors:
        if factor < len(arr):</pre>
            unique_indices.add(factor)
    if not unique_indices:
        return 0 # If no valid indices found
   total_sum = sum(arr[i] for i in unique_indices)
    return total_sum
# Example usage:
n = int(input().strip())
arr = list(map(int, input().strip().split()))
num = int(input().strip())
result = sum_of_prime_indices(arr, num)
print(result)
```
